Anti-Cancer and Anti-Microbial Activity of Hydro Alcoholic Extract of Bougainvillea glabra

Joshny J, Ramya Devi D, *Vedha Hari B.N

ABSTRACT
Bougainvillea glabra, a well known and spread decorative plant in India and many parts of the world, was reported to have various medicinal properties such as anthelmentic, anti-diabetic, antiviral and insecticidal activity. We have performed the present study to focus and evaluate the antimicrobial and anticancer activity of the plant extract. We used the hydro-alcoholic extract of Bougainvillea glabra leaves for the antimicrobial studies, to test against Yeast, Gram positive bacteria and Gram negative bacteria strains by disc diffusion method. We have also estimated its maximum bactericidal activity by the same technique. The yeast used in the study was Candida albicans, while the bacteria used were Salmonella typhi as Gram negative and Staphylococcus aureus as Gram positive. And we have used Chloramphenicol as the standard drug for antibacterial test and Fluconazole for antifungal activity. The in vitro anticancer study was tested using human cancer cell line HeLa in which the cell growth inhibition was determined with the help of MTT assay. The hydroalcoholic extract of B. glabra showed significant anticancer activity with an IC50 value of 47.11 μg/ml.

Key words: Gram positive bacteria, S.typhi, S.aureus, C.albicans, antimicrobial, anticancer, MTT assay.

INTRODUCTION
Plants have always been a part of medicinal science from the beginning of human civilisation to the present modern world of synthetic medicines. Even in the presence of variety of effective synthetic drugs, use of medicinal plants for maintaining human health has acquired a lot of importance in the present era. Though the modern antibiotics brought about a revolutionary change in eradicating the diseases, emergence of new antibiotic resistant pathogens brings up the need for a new antimicrobial active component search. Various phytochemical screening on plants revealed that the secondary metabolites synthesised by plants have many active components which have various properties like antimicrobial, antifungal, antidiabetic, anticancer, antioxidant etc. Hence from various studies the use of medicinal plant compounds in developing a new drug against different diseases has become a new field of research. Apart from antimicrobial active components the need of anticancer active component is also increasing day by day. This is because the rate at which cancer is
invading the humankind is very fast and its treatment is effective in slow pace. Due to these reasons search for an anticancer active component has turned to be a necessary factor. *Bougainvillea glabra*, also called as paper flower is a climbing evergreen woody ornamental shrub which inhabited to warmer climates is a native to Brazil and now also seen in areas like Middle East, Indian Subcontinent, and North America etc. *B. glabra* from the family of Nyctaginaceae belongs to the genus *Bougainvillea* and this genus has 18 species of plants of which three of them *B. spectabilis*, *B. glabra* and *B. peruviana* have gained a lot of importance in the horticulture field. *B. glabra* is reported to have a wide range of medicinal properties like antiviral, antioxidant, antibacterial, anti inflammatory, anti diabetic, anti fertility and also considered to be larvicidal.

Considering all these facts, we planned for an investigation on *B. glabra* leaves to evaluate its antibacterial and anti cancer activities. Thus the present study mainly aims at the evaluation of antimicrobial anti cancer activity, using extraction of dried leaves.

**MATERIALS AND METHODS**

Plant materials: *B. glabra* fresh leaves were collected from Trichy, Tamil Nadu, India in the month of December and this was authenticated by Dr. N. Ravichandran, CARISM, SASTRA University, Thanjavur- 613 401.

Drying and Milling: The fresh leaves were dried under shade at room temperature for 2 weeks which helps to prevent the loss of active compounds from plants and mixer was used to ground the dried leaves to coarse powder for better and complete extraction of medicinal compounds from the plant leaves.

Preparation of extract: The powder (45g) obtained by grinding was gently packed and extracted using soxhlet extraction method where petroleum ether (40-60⁰C) was first used to remove the fats and pigments, and the process was performed for 24 hrs. Further, hydroalcoholic solution in the ratio of 25:75 was introduced to treat the powder using same soxhlet extraction process for 24hrs and the extract obtained was evaporated to get a crude extract devoid of solvents at ambient conditions using water bath.

*In vitro* Anticancer Activity Evaluation by MTT assay:

Cell culture: The National Centre for Cell Science (NCCS), Pune provided the HeLa cell lines (human cervical adenocarcinoma cell) and this was grown in Eagles Minimum Essential Medium (EMEM) which contains 10% fetal bovine serum (FBS). All cells were maintained at 100% relative humidity at 37⁰C with 5% CO₂ and 95% air.

Cell treatment: To make single cell suspensions, the monolayer cells were treated with trypsin-ethylenediaminetetraacetic acid (EDTA) to detach the cells. The viability of cells were counted using hemocytometer and to make final density of 1x10⁵ cells/ml, the cell suspension was diluted using a medium containing 5% FBS. Each well in 96-well plate were seeded with 100μl of cell suspensions at plating density of 10,000cells/well and incubation for cell attachment was performed at same conditions at which cells were maintained. After 24 h the cells were treated with serial concentrations of the test samples. The test samples of different concentrations were prepared by serial dilution method. For this first the test samples were dissolved in pure dimethylsulfoxide (DMSO) then dilutions were carried out using serum free medium. Aliquots of 100 μl of these different drug dilutions were added to to 100 μl of medium present in the wells, gave the required final drug concentrations of 6.25, 12.5, 25, 50, 100 μg/ml respectively. Followed by the addition of drugs, the plates
were incubated for an additional 48 h at 37 °C with 5% CO₂, 95% air and relative humidity of 100%. The medium containing without samples were served as control and triplicate was maintained for all concentrations.

**MTT Assay** After 48h of incubation, each well was added with 15µl of MTT (5mg/ml) in phosphate buffered saline (PBS) and incubated at 37°C for 4h. The medium with MTT was then flipped off and the formazan crystals formed were then solubilized in 100µl of DMSO. The absorbance was measured at 570 nm using micro plate reader. The % cell inhibition was determined using the following formula:

\[
\% \text{cell Inhibition} = \frac{100 - \text{sample absorbance}}{\text{Control absorbance}} \times 100
\]

**STATISTICAL ANALYSIS**

The IC₅₀ is half the maximal inhibitory concentration of the toxic compound which results in the reduction of biological activity by 50%. Nonlinear regression graph was plotted between % Cell inhibition and Log₁₀ of concentration and IC₅₀ was determined using GraphPad Prism software. The differences are considered to be statistically significant when p < 0.05.

**Antimicrobial Activity Evaluation** Sub culturing of Test Organisms- For the antimicrobial activity, the bacterial strains used were *Salmonella typhi* (Gram negative bacteria), *Staphylococcus aureus* (Gram positive) which were suspended in Nutrient broth and kept for incubation at 37 °C for 24hrs. Potato dextrose broth was used to suspend the yeast strain *C.albicans* and was incubated for 3days at room temperature.

**Sample Preparation** The 0.1ml of *B.glabra* hydro alcoholic extract was dissolved in 2% DMSO and used for the antimicrobial screening.

**Agar well diffusion method:** The 24h broth cultures of different bacteria are seeded on to the Muller Hinton Agar plates and then bored with 5 wells each of 10mm diameter using sterile cork borer. Each well was added with various concentrations (25, 50, 75, 100mg/ml) of the hydroalcoholic extract along with a control (0.1 ml of 2% DMSO). The standard antibiotic discs were also simultaneously placed into the wells and plants were allowed to diffuse at room temperature for 2hrs. Then plates were incubated at 37 °C for 18-24hrs and at room temperature for 3 days for bacteria and fungi respectively. The plates were removed at specified time interval and measured for zone of inhibition. By measuring the diameter of zone of inhibition, the antimicrobial activity was determined and compared with both standard and control.

**Minimum bactericidal/fungicidal (MBC/MFC) concentration:** The MBCs were determined by colony count method. For this a 10µl from each of the culture was sub-cultured onto Muller Hinton agar plates which were then incubated for 24 h at 37 °C for bacteria and 3-4days at room temperature for fungi. The lowest concentration at which no growth was observed was noted by counting the number of colonies.

RESULTS

In vitro Anticancer Activity: In our present study the impact of hydroalcoholic extract of *B. glabra* on the growth of HeLa cell line was examined by performing MTT assay. After the treatment of cell line with various concentrations of extract, the results from MTT assay shows that there is an exponential increase in the growth inhibition as the concentration is increased. The results of the growth inhibition with increase in concentration against Hela cell line is shown in Table 1 and the fig 1.

At lowest concentration of 6.25μg/ml it showed an inhibition of 7.2% and at highest concentration of 100μg/ml it showed an inhibition of 76.36%. The hydroalcoholic extract of *B. glabra* was showing a promising inhibitory activity against the HeLa cells showing an IC50 value of 47.11μg/ml with a regression of 0.9861.

Antimicrobial Activity: The antimicrobial activity of hydroalcoholic extract of *B. glabra* was determined by the presence or absence of zone of inhibition and its diameter (mm), also minimum bactericidal concentration also determined. Results are as shown in Table 2:

From the data we can see that *B. glabra* showed no zone of inhibition for *Salmonella typhi* for 25mg/ml and 50mg/ml concentration of extract but showed good zone of inhibition for 75mg/ml and 100mg/ml. While in the
case of gram positive bacteria *Staphylococcus aureus* though it started showing zone of inhibition from 25mg/ml, the diameter of inhibition zone was less compared to the gram negative bacteria *Salmonella typhi* at 75mg/ml and 100mg/ml, showing that later is much effective than the former. The results were compared with standard antibiotic Chloramphenicol (10μg/disc) for bacterias. The antifungal activity was also proved by *Candida albicans*, which showed god zone of inhibition for all concentrations except for 25mg/ml, which was compared with the drug Fluconazole (10μg/disc).

Apart from zone of inhibition the antibacterial and antifungal activities were proven with MBC/MFC (minimum bactericidal/ fungicidal concentration) too. The results are as given below:

From the above results of MBC/ MFC confirms that gram negative bacteria *S.typhi* shows better activity than *S.aureus* as former showed MBC from 800mg/ml while later started showing only a t 1000mg/ml of extract. In the case of *C.albicans*, it showed MFC at a concentration of 400mg/ml from which we can infer that the hydroacohoic extract is effective against *C.albicans*.

**DISCUSSION**

There are various plant extracts which shows anticancer eff ects on various cell lines. Some of them includes, *Sansevieria roxburghiana*’s methanolic leaf extract which was evaluated against HepG2 liver cell line<sup>10</sup>, the ethanolic extract of the matured root of *S. baicalensis* against glioma cell lines showed good activity<sup>11</sup>, the diethyl ether extract Sukun (*Artocarpus altillis*) wood against Human Breast Cancer (T47D) Cells, the different solvent extract of whole plant of *Acanthus ilicifolius* (*Acanthaceae*) which was fractioned with different solvents were evaluated against HeLa and KB Cell lines where Ethyl acetate extract showed a good anticancer activity<sup>12</sup>.

Our study showed significant anti cancer activity for hydro alcholoc extract of *B.glabra* with an IC<sub>50</sub> of 47.11 μg/ml and % cell growth inhibition of 76.36 5 at 100 μg/ml. There are various other studies that support the results of the present study. Some of these studies include the ethanolic extracts of leaves of *C.parviflorum* which was examined for cytotoxic activity against two cell lines DLA and Hela cell where the results showed significant growth inhibition with IC50 61.24μg/ml for the former cells and 43.15μg/ml for the latter<sup>13</sup>. Similar results were also detailed in Raval P. Bhuvan et al. where the anticancer activity of bark extracts of *Symplocos*...

+ = lowest concentration with bactericidal/fungicidal activity
++ = Concentrations showing increase in bactericidal activity

racemosa Roxb. (Sympliococaceae) in different solvents which was assessed against HL60 (Human leukemia cell line) and HeLa (Human cervix cancer cell). In the above study they found that Butanol extract showed good cytotoxic activity against HL60 (Human leukemia cell line) with IC$_{50}$ 27183 ng/ml and HeLa (Human cervix cancer cell Line) with IC$_{50}$ = 22861 ng/ml whereas Ethyl acetate extract showed less cytotoxic against HL 60 and HeLa with IC$_{50}$ 117084 ng/ml and 137151 ng/ml respectively. In another study on anticancer and cytotoxic activity against HeLa cells using saponins isolated from leaf extracts of Gymnema sylvestre and Eclipta prostrata also showed supportive results. The gymnemagenol from Gymnema sylvestre showed IC50 of 37 µg/ml and dayscyphin C from Eclipta prostrata showed IC$_{50}$ 50 µg/ml and maximum cell death shown was 73% for the former and 53% respectively. Hence from above discussions it can be reported that B. glabra can be a potent anticancer agent for further studies.

CONCLUSION
Thus the present study on anticancer and antimicrobial activity of hydroalcoholic extract of B. glabra shows strong evidence to become a potent natural remedy against cancer and infectious diseases. The strong activities witnessed in this plant may be due to the presence of certain phytochemical compounds present in it. Hence from present study we can conclude that an ornamental plant like B. glabra can also play an important role as medicinal plant. The isolation and structural elucidation of individual compounds can be performed to quantify the activity; also in vivo animal studies can be performed to confirm the activity.

ACKNOWLEDGEMENT
The authors express their sincere gratitude towards the authorities of SASTRA University, Thanjavur, India, for their extensive support and help for the successful completion of this work. Authors would also wish to acknowledge KMCH college of Pharmacy, Coimbatore, India, for the facilities availed to perform the anticancer study.
