ABSTRACT
The scientific basis for the statement that plants and their active constituents play an important role in the prevention diseases is continuously advancing. In fact, the origin of many therapeutic substances from the genus Vitex. The genus Vitex contains 270 species distributed around the world. It is an interesting source of potential bioactive molecules, as iridoids compounds, flavonoids, diterpenoids derivatives, phytosteroids, with antioxidant, anti-inflammatory, antimicrobial, Hepatoprotective activity, analgesic and antihistamine, Anti-implantation, antiasthmatic activities. This work reviews the pharmacological evidence of extracts of plants from the genus Vitex, giving an overview of the most studied biological effects and the known phytochemical composition. Although more studies are necessary, Vitex exhibits proven potential to become of important pharmacological interest.

Keywords: genus Vitex, Pharmacology, phytochemistry, antioxidant, Medicinal plants.

INTRODUCTION
In recent times, focus on plant research has increased all over the world, and a large body of evidence has been collected to show the immense potential of medicinal plants used in traditional systems. Various medicinal plants have been identified and studied using modern scientific approaches. The results revealed the potential of medicinal plants in the field of pharmacology. The genus Vitex approximately includes 270 known species of trees and shrubs within tropical and sub-tropical regions, although few species may be found in temperate zones. Vitex trifolia L. is a shrub or shrubby tree that may grow up to 6 m. Its origin is unknown and several varieties have been described in distant countries as India and Mexico. Several Vitex species are used as folk remedies in Mexico. Vitex mollis is reported as a remedy to alleviate dysentery, as well as an analgesic and anti-inflammatory medicine; other folk uses include the treatment of scorpion stings, diarrhea and stomach ache. Other Vitex species are folk remedies to treat diarrhea and gastrointestinal affections (V. piramidata, V. pubescens, V. agnus-castus and V. gaumerti). Also, antimalarial, antimicrobial, and antifungal properties have been reported for V. gaumerti, V. agnus-castus and V. negundo, respectively; V. negundo is also used as an anti-inflammatory agent, Vitex negundo (Family: Verbenaceae), is an important medicinal plant found throughout India. The all of its parts are used in Ayurvedic and Unani systems of medicine, the extracts from its leaves and roots are the most important in the field of medicine and drug. Its leaves and seeds are widely used externally for rheumatism and inflammations of joints and are also reported to have insecticidal properties. Internally, decocation of its leaves is taken as diuretic, expectorant, vermifuge, tonic and febrifuge. The chemical components of the essential oil of leaf isolated from Vitex negundo and other species while Vitex gaumerti is used to treat colds and coughing spells. It is well known that a considerable number of plant species, besides their popular use as medicine in many countries, India some species are present Vitex glabrata, Vitex leucoxylon, Vitex penduncularis, Vitex pinnata, and Vitex trifolia possess insecticidal activities. The genus Vitex sp. is not an exception. V. negundo has larvicidal activity against the mosquito species Culex quinquefasciatus and Anopheles stephensi, and acts as a deterrent to the mosquito Aedes aegypti. Vitex rotundifolia also shows deterrent properties towards A. aegypti. Several other Vitex species are currently being investigated in specific programs of pest control.

Vitex agnus-castus
Vitex agnus-castus L. (Verbenaceae) is a small tree or shrub, which is widely distributed along the Anatolian coastal lane. This plant has important medicinal properties and is especially used for treatment of premenstrual problems and hyperprolactinemia because of it is hormone-like effect. In Anatolian folk medicine, Vitex agnus-castus is used as

*Corresponding author: Mr. Uttam Singh, School of Pharmaceutical Sciences, Shobhit University, Meerut, Uttar Pradesh, India; Tel: +919023468472, 9451340239, +919779953364
E-mail: uttamiftm@gmail.com; ajaysheera@gmail.com
Vitex agnus-castus contains iridoids, flavonoids, diterpenoids, and ketosteroids. "Vitex agnus-castus is a medicinal plant with a long tradition in folk medicine as an aphrodisiac, anti-oestrous cycle effect, diseases, stomachache, relieves pain, euphestic, menagenic, antispasmodic, aperitif, soporific action, mastopathies, gallogogous, activity against P388 leukemia cells, inhibition of prolactin synthesis and inhibitor for dopamine D2 and opioid."

The methanolic extract of the flowering stems of Vitex agnus-castus yielded three new iridoids: 6'-O-foliamethoxy 13-hydroxyxylanousenic acid (agnucastoside A), 6'-O-(6,7-dihydrofolialmethyl) xussenaonic acid (agnucastoside B) and 7-O-trans-p-coumaroyl 6'-O-trans-raccoyl 8-épiloganic acid (agnucastoside C) in addition to four known iridoids (aucubin, agnuside, xussenaonic acid and 6'-O-p-hydroxybenzoylxussenaonic acid) and one known phenylbutanone glucoside (myzodendrone). The dried ripe fruit of Vitex agnus-castus L. is widely used for the treatment of premenstrual syndrome.

The chemical composition and antioxidant activity of the essential oil and different solvent extracts of Vitex agnus-castus. GC and GC–MS analysis was resulted in the detection of 27 components of the oil. Major components of the oil were 1, 8-cineole, cabenine, a-pinene, a-terpinyl acetate and (Z)-ß-farnesene. Antioxidant activities of the samples were determined by three different test systems, DPPH, ß-carotene/linoleic acid and reducing power assays. In all systems, water extract exhibited excellent activity potential than those of other extracts (hexane, dichloromethane, ethyl acetate and methanol) and the oil. As expected, amount of total phenolics was very high in this extract. Dichloromethane extract has been found to be rich in flavonoids. A positive correlation was observed between the antioxidant activity potential and total phenolic and flavonoid levels of the extracts.

The essential oils of Vitex agnus-castus were evaluated against Vth instar larvae of Spilosoma obliqua, when applied topically on the dorsal side of mesothoracic region, for insect growth regulatory activity. This treatment caused extended larval period and pupal period, increase in larval mortality and adult deformity and decrease in adult emergence, fecundity of female and egg fertility of test insect.

From the fruits of Vitex agnus-castus L. one new diterpene, 6ß, 7ß-diacetoxy-13-hydroxy-labda-8, 14-diene, as well as two previously described diterpenes rotundifuran and vitexifalactone (Fig. 2) were isolated. All obtained diterpenoids belong to the labdane type. The structures determinations were mainly based on 1D and 2D NMR spectra and MS data interpretation. 6ß, 7ß-diacetoxy-13-hydroxy-labda-8, 14-diene and rotundifuran showed an affinity to the dopamine-D2 receptor. Compound vitexifalactone identified by 1D and 2D NMR data and the MS spectrum and comparison of its spectroscopic data. Compound vitexifalactone was isolated from the leaves of Vitex cannabifolia (Linn.). All of the physical and spectroscopic data were identical with those of rotundifuran described in the literature. A novel labdane diterpene alkaloid, vitexilactam A (Fig. 3) was isolated as a prism from the n-hexane extract of the fruits of Vitex agnus-castus through normal and reverse phase column chromatography. Its structure was elucidated to be 6ß-acetoxy-9α-hydroxy-13(14)-labden-16, 15-amide, based on chemical and spectral evidences including 1D and 2D NMR spectra. The structure was confirmed by X-ray crystallographic analysis. Compound vitexatlam A Is the first naturally occurring labdane diterpene containing α, β-unsaturated γ-lactam moiety.

Extract of Vitex agnus-castus in the treatment of women suffering from premenstrual syndrome (PMS) with moderate to severe complaints. Investigate the efficacy and safety of Vitex agnus-castus extract in Chinese women suffering from moderate to severe premenstrual syndrome.

Four new flavonoids, luteolin 6-C-(4'-methyl-6'-O-trans-caffeoylglucoside), luteolin 6-C-(6'-O-trans-caffeoylglucoside), luteolin 6-C-(2'-O-trans-caffeoylglucoside), and luteolin 7-O-(6'-p-benzoylglucoside), together with four known ones 5, 4'-dihydroxy-3, 6, 7, 3-tetramethoxyflavone, luteolin, arteetin and isorhamnetin, were isolated from the root bark of Vitex agnus-castus. The structures were elucidated by spectroscopic means.

A methanol extract of Vitex agnus-castus L. was tested for its ability to displace radioiodelabeled estradiol from the binding site of estrogen receptors alpha (ERa) and beta (ERß). Progesterone receptor was upregulated in the Ishikawa endometrial cancer cell line. However, chaste-tree berry extract did not induce estrogen-dependent alkaline phosphatase activity in Ishikawa cells. Bioassay-guided isolation, utilizing ER binding as a monitor, resulted in the isolation of linoleic acid as one possible estrogenic component of the extract. The use of pulsed ultrafiltration liquid chromatography-mass spectrometry, which is an affinity-based screening technique, also identified linoleic acid as an ER ligand based on its selective affinity, molecular weight, and retention time. Linoleic acid also stimulated mRNA ER ß expression in T47D:A18 cells, PR expression in Ishikawa cells. The antiepileptic activity of hydrophilic extract of Vitex agnus-castus fruit (Vitex) was evaluated by the kindling model of epilepsy. Intact male rats were stereotaxically implanted with a tripolar and two monopolar electrodes in amygdala and dura, respectively. These results indicate that Vitex can reduce or prevent epileptic activity as demonstrated by reduction of after discharge duration and length of convulsion in a dose dependent manner. In conclusion, Vitex at appropriate dose can probably reduce or control epileptic activities.

The essential oils from leaf and fruit of Vitex agnus-castus for menopausal balance were conducted. Surveys completed by the some participants in that trial indicated strong symptomatic relief of common menopausal symptoms. The result of the second round of trials, which were conducted with more additional subjects under the supervision of health practitioners. The second trial appears to support the finding of the first trial, as well as identifying some important contraindications to use of the essential oil. Subjects who mixed essential oil vitex with any form of progesterone supplementation (including progesterone cream) consistently noted breakthrough bleeding. Any woman who is concurrently taking any form of hormone replacement therapy should be closely monitored by a health professional when vitex is introduced. Extracts of Vitex agnus-castus are used for the treatment of premenstrual symptoms. The mechanism of action was proposed to be dopaminergic and estrogenic in nature. To
isolate these endocrinologically active substances, receptor ligand binding assays and cell cultures were used as in vitro systems to monitor the bioactivity-guided chromatographic separation. The fraction with the highest dopaminergic activity was a mixture of diterpenes of the clerodane type. These newly isolated diterpenes inhibited cAMP formation and PRL-release in rat pituitary cell cultures. The estrogenic compounds were identified as the flavonoids penduletin and apigenin. Both substances are specific ligands for the ERβ. Using the strategy of bioactivity-guided fractionation we were able to isolate new dopaminergic diterpenes with a high specific activity which contributes significantly to the PRL-lowering activity of Vitex agnus-castus. The therapeutic potential of the ERβ specific ligands penduletin and apigenin needs further investigation. Starting material for the isolation of single constituents was the Vitex agnus-castus extract which was obtained by extracting finely ground Vitex agnus-castus seeds with aqueous ethanol 70 % (v/v) and smoothly drying in vacuum. [55] (Fig. 4). Ethanol extract of the dried ripe fruit of Vitex agnus-castus displays cytotoxic activity against certain kinds of human cancer cell line resulting in the induction of apoptosis. In this paper, we investigate the molecular mechanism of apoptosis induced by Vitex using a human gastric signet ring carcinoma cell line, KATO-III. DNA fragmentation was observed in Vitex-treated KATO-III cells in a time- and dose-dependent manner. Results demonstrate that intracellular oxidative stress and mitochondrial membrane damage is responsible for Vitex-induced apoptosis, which may be mediated by a diminution of reduced type glutathione within the cell. [56] Vitex agnus castus extract inhibits prolactin release which is caused by selective stimulation of pituitary dopamine receptors of the D2-type. [57-58] In clinical investigations and double-blind trials with preparations containing Vitex agnus castus extract, a decrease of latent and pathologically increased prolactin levels and an influence on prolactin release in healthy subjects has been demonstrated. [59-64] In a placebo-controlled, randomized, double-blind study the efficacy of a Vitex agnus castus extract containing solution was investigated in patients suffering from cyclical mastalgia. Patients had mastalgia on at least 5 days in the pre-treatment cycle. During this cycle and during treatment the intensity of mastalgia was recorded once per cycle using a visual analogue scale. Vitex agnus castus extract appears effective and was well tolerated and further evaluation of this agent in the treatment of cyclical mastalgia is warranted. [65] Vitex trifolia Linn Vitex trifolia L. (Labiatae) is a tropical shrub widespread in Pacific-Asian countries such as India, Sri Lanka, China, Philippines, Indonesia, North Australia, New Caledonia and French Polynesia. It has also been reported from East Africa and introduced to many islands in the Central Pacific and Hawaii. [66] The anti-inflammatory potential of an aqueous extract of Vitex trifolia leaves was evaluated by monitoring its effects on the modulation of cytokines, the mediators of inflammation, as well as on the expression profiles of inducible nitric oxide synthase which produces the free radical nitric oxide. [67] Vitex trifolia L. (Labiatae) appears as one of the popular herbal medicine in the Pacific region. The leaves are employed in maceration or decoction, internally or externally in baths to cure Ciguatera Fish Poisoning-related pruritus. [68-69] Vitex trifolia is used to treat various disorders like fever, inflammation, health care, and increase in body weight, nematocidal activity and anti-tumor activity. [70-74] Biological assays of Vitex trifolia L. organic extracts have shown relevant activities. Hexanic and dichloromethanol extracts, when prepared from stems and foliage, have proved to be very toxic against several cancer cell lines in culture. Also, an important antifeeding activity against the insect pest Spodoptera frugiperda (Lepidoptera: Noctuidae) was recorded. The hexanic extract from leaves completely inhibited the growth of the fungal plant pathogen Fusarium sp. [75] The essential oils of Vitex trifolia were evaluated against Vth instar larvae of Spilosoma obliqua, when applied topically on the dorsal side of mesothoracic region, for insect growth regulatory activity. This treatment caused extended larval period and pupal period, increase in larval mortality and adult deformity and decrease in adult emergence, fecundity of female and egg fertility of test insect. [76] An abietane-type diterpene, named vitetriterpin A, and two labdane-type diterpenes, named vitetritrifolins B and vitetritrifolin C, were isolated from the acetone extract of the fruits of Vitex trifolia L. along with three known diterpenes, rotun-difuran, dihydrosolidagenone and abietatriene 3β-ol. The structures of these compounds were elucidated on the basis of spectroscopic analysis, X-ray crystallographic analysis and chemical evidence [77] (Fig. 6). The petroleum ether and ethanol extracts of Vitex trifolia leaves exhibited moderate inhibiting activity against both gram-positive and gram-negative bacteria. [78] Vitex cymosa Vitex cymosa Bertero is a small tree widely distributed in the Central and Amazon regions of Brazil, where it is popularly known as Taruma-do-ígapo and Taruma-do-alagado. A new ecysteroid, 26-hydroxypinatasterone, together with 20-hydroxyecdysone, was isolated from the stem barks of Vitex cymosa. [79] Vitex polygama The species Vitex polygama Cham. is found mainly in the states of Bahia, Minas Gerais and Rio de Janeiro and the bark and fruits of this plant are traditionally used as emenagogue and diuretic. The 20-Hydroxyecdysone, ajagurasterone C, ajagurasterone C monoacetone and turkesterone were isolated from the branches of Vitex polygama. [80] Vitex canescens Vitex canescens Kurz is a medium-sized tree scattered throughout the countryside of Thailand. A number of Vitex species have been investigated for ecysteroids. [81] Among the Vitex species reported to be endemic to Thailand, only two of them, Vitex pinnata and Vitex glabrata, were reported to contain 20-hydroxyecdysone (1) and turkesterone (2). [82-83] The former plant species also contained pinnatasterone (3), an ecysteroid lacking a C-22 hydroxyl group. In the isolation of 1 and 2, and a new ecysteroid canescenasterone (4),from the bark of V. canescens [84] (Fig. 5), 20-hydroxyecdysone and turkesterone, a new ecysteroid, canescenasterone, was isolated from the bark of Vitex canescens A new ecysteroid, 24-epi-abutasterone, was isolated from the root bark of Vitex canescens. 20-Hydroxyecdysone, 24-epi-makisterone A, shidasterone, calonysterone and turkesterone were also isolated from this plant species. [85] Vitex negundo Linn Vitex negundo Linn. Verbenaceae, known as Nirgundi in Hindi, grows gregariously in wastelands and is also planted
as a hedge-plant. It is an erect, 2–5 m in height, slender tree with quadrangular branchlets distributed throughout India. The leaves have five leaflets in a palmately arrangement, which are lanceolate, 4–10 cm long, hairy beneath and pointed at both ends. The bluish purple flowers are numerous. The fruit is succulent, black when ripe, rounded and about 4 mm in diameter. [86-87]

Phytochemical studies on *Vitex negundo* have afforded several types of compounds, such as volatile oils [88-91], lignans [92-93], flavonoids [94-96], iridoids [97-99], terpenes (triterpenes, diterpenes, sesquiterpenes) [100-101], and steroids [102].

The most flavonoid glycoside from Leaves of *Vitex negundo* of Ethanolic extract is 5-hydroxy-3, 6, 7-trimethoxy-2-(3, 4-dimethoxyphenyl)-4H-chromen-4-one and 5, 7-dihydroxy-2-(3, 4-dihydroxyphenyl)-4H-chromen-4-one. Methanolic extract also contains, Negundoside, Agnuside, Vitegnoside (Fig. 7). Bark of *Vitex negundo* Linn. *p*-Hydroxybenzoic acid (1) and β-sitosterol (2) (Fig. 8) were isolated, and identified from the methanol and hexane extracts of *Vitex negundo*.

From the seed of *Vitex negundo* L. The folling compound isolated acetoacetatefation, twophenyllnaphthale-
lentypilignans. (Fig. 9) were obtained and identified as 6-hydroxy-4-(4-hydroxy-3-methoxy-phenyl)-3-hydroxy-
methyl-7-methoxy-3,4-dihydro-2-naphthaldehye(1) and vitedoamine A (2), both of which have been previously and isolated from the seeds of *Vitex negundo*. Powdered roots are used for piles as a demulcent for dysentery. It also used in dyspepsia, colic, rheumatism, worms, boils and leprosy. The roots contain a furanoeuramilphane. They are used as an antitode to snake venom. Tyrosinase inhibitory lignin’s from the methanol extract of the roots of *Vitex negundo* Linn. Hepatoprotective activity of *Vitex negundo* leaves ethanolic extract was investigated against hepatotoxicity produced by administering a combination of three anti-tubercular drugs isoniazid -7.5 mg/kg, rifampin-10 mg/kg and pyrazinamide-35 mg/kg. *Vitex negundo* Linn. contains many polyphenolic compounds, terpenoids, glycosidic iridoids and alkaloids. Since polyphenolic compounds have high antioxidant potential, the antioxidant potency of *Vitex negundo* was investigated by employing various established in vitro systems, such as 2, 20-azino-bis 3-ethyl benzothiazoline- 6-sulfuric acid /Lipid Peroxide /Superoxide/Hydroxyl radical scavenging and iron ion chelation.
The oral anti-inflammatory, analgesic and antihistamine properties of mature fresh leaves of Vitex negundo Linn. claimed in the Ayurvedic medicine by orally treating a water extract of the leaves to rats. The carrageenan-induced rat paw oedema was significantly suppressed in inversely dose-dependent manner [8] anti-hyperglycemic activities. [105] Vitex negundo showed significant activity against E. coli, K. aerogenes, P. vulgaris and P. aerogenes at all dosages. Extract of leaves of V. negundo showed activity against bacteria. [108] Ethanolic extract and various fractions like petroluem ether, aqueous leaves of Vitex negundo were prepared. The antiasthmatic activity evaluated by various experimental models like mast cell degranulation. [109] Anti-implantation activity of the methanolic extract of leaves of Vitex negundo Linn. Pregnant female mice. [109] Xanthine oxidase inhibitory activity was assayed from Vitex negundo. The methanolic root extracts of Vitex negundo Linn. and Emblica officinalis Gaertn. were explored for the first time for anti snake venom activity. The plant (Vitex negundo and Emblica officinalis) extracts significantly antagonized the Vipera russellii and Naja kauithia venom induced lethal activity both in vitro and in vivo studies. [111] Petroleum ether extracts of the leaves of Vitex negundo were evaluated for larvicidal activity against larval stages of Culex tritaeniorchius in the laboratory. [112] Crude aqueous extract of Vitex negundo Linn. leaves at investigated for laxative activity. [113] Ethanolic extracts of Vitex negundo were taken for ananthelmintic activity against Indian earthworm Pheritima posthuma.

**Vitex peduncularis Wall**
The dried leaves on extraction yielded pachypodol,ursolic acid, 2α-hydroxyursolic acid, vextin and pedunclarcin . In Orissa, a decoction of the leaves is taken as tea during cold season. Infusion of leaves administered intramuscularly or orally in Rabbits increases the osmetic resistance of cells and inhibits haemolysis by saponin, cobra venom, bile salts, or saline solution. [114]

**Vitex pinnata**
An ecdyysteroid, pinnatosterone, together with 20-hydroxyecdyson and turkesterone were isolated from the bark of the plant. Pinnatastered showed low biological activity in the puerpation test with housefly larvae. [86] The Flavonoids, luteolin, iso-orientin, and vitexin have been isolated from the flowers. In Brunei, the young leaf shoots are eaten raw to counter hypertension and fever. The shoots are also used for poultichings wounds. A root-tea is consumed for backache, bodyache and fatigue. [115]

**Vitex leucocylon Linn**
Ethanolic extract and cold aqueous infusion of leaf were found to depress spontaneous motor activity. Both the extracts suppressed acetic acid induced writhing in mice and carrageenan-induced hind paw oedema in rats. Besides Ethanolic extract produced significant inhibition of granulation tissue formation while cold aqueous infusion decreased total serum cholesterol. In acute inflammation, cold aqueous infusion as well as a mixture of Flavonoids of Vitex leucocylon Linn showed anti-inflammatory activity without any effect on chronic inflammation. [116]

The main biological findings and the known phytochemical composition of the Vitex genus are summarised in Table 1. The studies conducted to date have demonstrated that the plants of the Vitex genus have the potential to provide biologically active compounds that act as antioxidants, anti-inflammatory, antimicrobial, Hepato-protective activity, analgesic and antihistamine , Anti-implantation, antiasthmatic activities. Thus, the Vitex genus deserves additional evaluation as a provider of Hepatoprotective agents. Indeed, there is a current need for availability of new plant-derived bioactive molecules; thus genus Vitex may be a great natural source for the development of new drugs and may provide a cost-effective mean of treating Heart problem and other diseases in the developing world.
