**ABSTRACT**

The present study has been designed to explore the beneficial effect of *Momordica charantia* in partial abdominal aortic constriction (PAAC) induced cardiac hypertrophy in rats. The male wistar rats were anaesthetized with thiopentone sodium and were subjected to Partial Abdominal Aortic Constriction (PAAC) for 4 weeks. The treatment with ethanolic extract of *Momordica Charantia* (EMC) (200 mg/kg and 400 mg/kg) was started three days before surgery and it was continued for 4 weeks after surgery. The development of left ventricular (LV) hypertrophy was assessed by measuring ratio of LV weight to body weight (LVW/BW), LV wall thickness (LVWT), LV protein content, LV collagen content and LV RNA concentration. Further mean arterial blood pressure (MABP) was recorded. Moreover, DNA gel electrophoresis was employed to assess the myocardial cell death. The PAAC significantly increased the ratio of LV weight to body weight, LV wall thickness, LV protein content, LV collagen content and LV RNA concentration. Further PAAC significantly increased MABP and myocardial cell death. The EMC (400mg/kg) markedly attenuated PAAC induced increase in LV hypertrophy, MABP and LV necrotic cell death. These results implicate ameliorative role of *Momordica Charantia* in PAAC induced myocardial cell death and pathological cardiac hypertrophy.

**Keywords:** Aortic constriction, Cardiac hypertrophy, *Momordica Charantia*

**INTRODUCTION**

Cardiac hypertrophy is a major predictor of progressive heart disease and an adverse prognosis. It is recognized as an adaptive process to a variety of physiological and pathological conditions like ischemic heart disease, hypertension and heart failure. Hence, it is a well established risk factor for cardiovascular mortality in patients. The induction, progression, and subsequent detrimental effects of cardiac hypertrophy is characterized by an increment in cardiomyocyte size, increased protein synthesis and changes in the organization of sarcomeric structure. *Momordica Charantia* fruit is usually oblong and resembles a small cucumber. The published reports indicate that the plant is having anthelmintic, antibacterial, antibiotic, antidiabetic, antiinflammatory, antileukemic, antimicrobial, antimitogenic, antimycobacterial, antioxidant and antitumor activities. Moreover, *Momordica Charantia* fruit is a PPAR ( Peroxisome proliferator activated receptor) dual agonist and its role in cardiac dysfunction still remains unexplored. Peroxisome proliferator activated receptor (PPAR) belongs to a class of nuclear receptors and is involved in regulation of genes responsible for glucose and lipid metabolism. The role of PPAR agonists in various cardiovascular complications such as vascular endothelial dysfunction, myocardial ischemia reperfusion-induced injury, hypertension, and hypertension-induced cardiac hypertrophy has been explored. Moreover, PPAR-dual agonists such as *momordica charantia* recently have been reported to exhibit beneficial effect in diabetes and vascular endothelial dysfunction. However, the effect of PPAR dual agonists in cardiac hypertrophy still remains unexplored. Hence, the present study has been designed to investigate the role of *momordica charantia* in partial abdominal aortic constriction-induced cardiac hypertrophy in rats.

**MATERIALS AND METHODS**

Male Wistar albino rats weighing 200 to 230 g were used in the present study. They were maintained on rat feed and water ad libitum and were exposed to a 12-hour light and 12-hour dark cycle. The Institutional Animal Ethics Committee approved the experimental protocol and care of the animals was carried out as per the guidelines of the Committee for the Purpose of Control and Supervision of Experiments on Animals (CPCSEA), Ministry of Environment and Forest, Government of India (Reg. No. 10/2010/CPCSEA).

Figure 1. HPTLC spectra of standard Charantin

Figure 2. HPTLC spectra of Ethanolic extract of Momordica Charantia
on the ethanolic extracts using the standard procedures to carbohydrates, fats, proteins and volatile oils [7,8].

Futhermore, standardisation of the ethanolic extract was done by HPTLC using Benzene: Methanol (80:20 v/v), detected at 536 nm (Mukherjee, 2002) (Table 1, 2 and Fig. 1, 2). In the Ethanolic extract of *Momordica Charantia*, charantin was detected at Rf 0.38 which showed resemblance to standard charantin.

**Experimental Design:** The present study comprised six groups with each comprising of 12 to 14 animals. In Group 1 (sham operated), surgery was performed to expose the abdominal aorta but it was not constricted. In Group 2 (PAAC group), surgery was performed and rats were subjected to partial abdominal aortic constriction. In Group 3 (sham operated low treatment group), rats were subjected to surgery without aortic banding and were treated with ethanolic extract of *momordica charantia* (200 mg/kg per day orally) for three days before surgery and it was continued for 4 weeks after surgery. In Group 4 (sham operated high treatment group), rats were subjected to surgery without aortic banding and were treated with ethanolic extract of *momordica charantia* (400 mg/kg per day orally) for three days before surgery and it was continued for 4 weeks after surgery. In Group 5 (treatment low dose), rats were administered ethanolic extract of *momordica charantia* (200 mg/kg per day orally) for three days before PAAC and it was continued for 4 weeks after surgery. In Group 6 (treatment high dose), rats were administered ethanolic extract of *momordica charantia* (400 mg/kg per day orally) for three days before PAAC and it was continued for 4 weeks after surgery.

**Morphologic Assessment of Cardiac Hypertrophy:** At the end of the four weeks, the rats were euthanized and hearts were excised and washed with cold saline. The left ventricular weight including interventricular septum and right ventricular weight was noted separately and expressed as milligrams per gram of body weight. The left ventricle was divided into three parts and wall thickness of each slice was noted at eight different parts using an ocular micrometer. The mean value of all three slices was taken and expressed in millimeters [18].

PAAC, partial abdominal aortic constriction; EMC, Ethanolic extract of *Momordica Charantia*; MABP, mean arterial blood pressure; BW, body weight; LVW, left ventricular weight; LVWT, left ventricular wall thickness. Values are mean±SEM a: p<0.05 vs sham control; b: p<0.05 vs PAAC control.

**Phytochemical screening:** Chemical tests were carried out on the ethanolic extracts using the standard procedures to identify the presence of glycosides, saponnins, flavonoids, alkaloids, tannins, triterpenids, phytosterols, carbohydrates, fats, proteins and volatile oils [7,8]. Furthermore, standardisation of the ethanolic extract was done by HPTLC using Benzene: Methanol (80:20 v/v), detected at 536 nm (Mukherjee, 2002) (Table 1, 2 and Fig. 1, 2).

**Biochemical Assessment:** The left ventricle was stored at −80°C in liquid nitrogen for quantitative estimation of biochemical parameters. The left ventricle was homogenized and protein content was determined spectrophotometrically at 750 nm by Lowry’s method [21] and expressed as mg/g of left ventricular weight. The RNA was extracted from homogenized left ventricular tissues using method of Chomczynski and Sacchi [22]. RNA concentration was determined spectrophotometrically at 260 nm. One absorbancy unit at 260 nm in a 1 cm light path cuvette was assumed to be equal to 40 μg/mL of RNA. The purity of RNA was assessed by determining the ratio of absorbance at 260 and 280 nm and the ratio was more than 1.8. The DNA was extracted from homogenized left ventricular tissue using method of Ausubel et al [22]. The concentration of DNA was determined spectrophotometrically at 260 nm.

**DNA Gel Electrophoresis:** 12 μg of extracted DNA was added to equal volume of loading dye (40% sucrose, 0.1% bromophenol blue, 0.7% sodium dodecyl sulphate) and the mixture was loaded in the well. Electrophoresis was carried out using 1.8% agarose gel in 1 x TBE buffer (Tris HCl 89 mM, boric acid 89 mM, EDTA 2 mM) for 1.15 hr at 400 mA, 50V and 3W in submarine electrophoresis apparatus (Pharmacia Biotech, Freibury, Germany). Ethidium bromide (0.5μg/mL) was added to the gel for DNA detection [18].

**Measurement of Mean Arterial Blood Pressure:** The mean arterial blood pressure (MABP) in carotid artery of anesthetized rats was recorded using a pressure transducer (BIOPAC System, Goleta, CA) just before morphologic and biochemical studies [18].

**Drugs and Chemicals:** Atorvastatin was obtained as a kind gift from Ranbaxy Lab. Ltd, Gurgaon, India. Folin-Ciocalteu’s Phenol Reagent, Tris buffer, agarose and Chloramine T were purchased from Loba Chemie, Coimbatore, India. Sarcosyl and Proteinase K were procured from Sigma-Aldrich, Mumbai, India. All other reagents used in the present study were of analytical grade.
STATISTICAL ANALYSIS
The results were expressed as mean ± standard deviation. The data obtained from various groups were analyzed using one-way analysis of variance followed by Tukey’s multiple range test. The $P$ value <0.05 was considered to be statistically significant.

RESULTS
There was no significant change in body weight of rats subjected to sham surgery and partial abdominal aortic constriction with or without the *momordica charantia* treatment.

Effects of Ethanolic extract of *Momordica Charantia* Treatment on Morphologic and Haemodynamic Parameters: No significant change in body weight was observed in rats subjected to partial abdominal aortic constriction (PAAC) (Table 3). PAAC resulted in a significant increase in ratio of left ventricular weight to body weight (LVW/BW) and left ventricular wall thickness (LVWT) as compared to the control group and sham group. However, treatment with *momordica charantia* (200 and 400 mg/kg per day orally) significantly attenuated PAAC-induced increase in LVW/BW and LVWT in a dose-dependent manner (Table 3).

Effect of Ethanolic extract of *Momordica Charantia* Treatment on Left Ventricular Collagen Content: A significant increase in left ventricle collagen content was observed in the rats subjected to PAAC as compared with rats in the sham treated group. The treatment with *momordica charantia* significantly attenuated PAAC-induced increase in collagen content in a dose-dependent manner (Table 3).

Effect of Ethanolic extract of *Momordica Charantia* on Electrophoretic Pattern of DNA: PAAC produced DNA smearing in agarose gel electrophoresis. The DNA smearing is the marker of necrotic cell death. *Momordica charantia* (200 and 400 mg/kg per day orally) significantly reduced PAAC-induced DNA smearing (Figure 3).

DISCUSSION
The partial abdominal aortic constriction (PAAC) model used in this study [16, 17] involves placing a suture on the aorta below the diaphragm leading to pressure overload induced left ventricular hypertrophy. PAAC subjected for 4 weeks produced significant cardiac hypertrophy as witnessed by increased ratio of left ventricular (LV) weight to body weight, LV wall thickness, LV protein content, LV collagen deposition and LV RNA
