ABSTRACT

The investigation aimed to carry out the In-vitro antimicrobial activities of the benzene and chloroform extract of *Mucuna pruriens* seeds. The antimicrobial activity of the extract was determined by the agar well diffusion method against various gram positive, gram negative and spore forming microorganisms and fungi. The chloroform and benzene extract of *M. pruriens* shown antimicrobial activity against the tested microorganisms *E. coli*, *Candida albicans*, *Rhodococcus rhodochrous* and *Arthrobacter protothormiae* but chloroform extract shown broad-spectrum antimicrobial activity against *Arthrobacter protothormiae*. The results obtained in the study shows that chloroform extract of *M. pruriens* has more antimicrobial activity against *Arthrobacter protothormiae* because it shown large diameter of Zone of Inhibition (ZI).

Keywords: Mucuna pruriens, benzene, chloroform, antimicrobial.

INTRODUCTION

Plants were use for treating various diseases in an age old practice in a large part of the world especially in developing countries were dependence on traditional medicine for variety of diseases. Long before the advent of modern medicine herbs were main stream remedy for nearly all ailments. Microorganisms and medicinal plants are rich sources (remedies for nearly all ailments) of secondary metabolites, which were the potential sources of useful drug and other useful bioactive products. There was a great interest in plants with antimicrobial properties, has revived as a result of current problems such as resistance associated with the use of antibiotics. The primary benefits of using plant derived medicine derived that they were relatively safer than synthetic alternative offering profound therapeutic benefits and more affordable treatment. Usually these natural products extracted and isolated from plants. These extracts show various medicinal properties, among which one is the antimicrobial property. Over the past several years, intensive efforts have been made to discover clinically useful antimicrobial drugs, which have been reviewed by many researchers.

*Mucuna pruriens* plant is commonly called as common cowitch, velvet bean, cowhage, kapikachhu and naikaranam. It is a constituent of more than 200 indigenous formulations. The fruit of the plant is thick and leathery. *Mucuna pruriens* belongs to the family Leguminoseae. *Mucuna pruriens* is an annual climbing legume indigenous to tropical regions, especially Africa, India and West Indies. In India it is found in the foothills of the Himalayas, the plains of West Bengal, Madhya Pradesh, Karnataka, Kerala and Andhra Pradesh. The plant is infamous for its extreme itchiness produced on contact, particularly with the young foliage and the seed pods. The plant is an annual, climbing shrub with long vines that can reach over 15 m in length. Seeds contain alkaloid constituents mucanadine, mucunine, prurienidine, prurienine, epoxy fatty acids such as cis-12,13-epoxyoctadec-trans-9-cis-acid, cis-12,13-epoxyoctadec-trans-9-enoic acid.

*Mucuna pruriens* has also shown to exhibit neuroprotective effect by increase brain mitochondrial complex-I activity and significantly restoring dopamine and norepinephrine levels in Parkinsonism animal model. *Mucuna pruriens* possesses a wide range of pharmacologic activities such as antimicrobial activity, anti-protozoal activity, anti-inflammatory activity, neuroprotective activity, anti diabetic activity, antioxidant activity. Literature has shown that the biological activities of plant extracts essential oils and their individual pure components and has documented the inhibitory activity of these substances against the growth of various fungi. There is a general growing trend among consumers for more natural than synthetic products in a whole range of industries, including food and drink, cosmetics, agricultural and pharmaceuticals.

MATERIALS AND METHODS

*Author for correspondence: E-mail: dagarvikran@gmail.com*
Plant Material and Microbial flora: Fresh beans of *Mucuna pruriens* (Genus- *Mucuna*, Family- *Fabaceae*) were collected from the rural area (Kaliar in Roorkee). The Plant material was thoroughly washed in water and dried plant material was ground to powder and 30gms of the dried plant material was used for the extraction.

Microbial flora: [obtained from Microbial Type Culture Collection & Gene Bank (MTCC), Institute of Microbial Technology, Chandigarh, India] see (Table 1.).

Standard antibiotic solution: Suprimox, Amoxicillin 250mg vial

Suprimox: INJ from Ranbaxy (Rexcel).  
Dose: 10mg/ml  
Vehicle used: Water for injection

**Extraction Process:**  
Extraction with Benzene: The dried seeds were crushed to reduce size which subjected to soxhlation was exhaustively extracted with benzene for 6 hours. Collect the extract in beaker and evaporate the solvent in hot-air oven at 40-50°C to

obtained dried contain. Stand the dried extract[1.590gm] in closed container. Percentage yield of benzene extract of Mucuna pruriens was 5.29% (Table 2.). Extraction with chloroform
The dried seeds were crushed to reduce size which subjected to soxhlation was exhaustively extracted with chloroform for 6 hours. Collect the extract in beaker and evaporate the solvent in hot-air oven at 40-50°C to obtained dried contain. Stand the dried extract[1.20gm] in closed container. Percentage yield of chloroform extract of Mucuna pruriens was 4.0% (Table 3.).

Antimicrobial Activity of Mucuna Pruriens: A part from the studied of phytochemistry, the plant extract was also
subjected to anti microbial studies. To carry out these studies Pour plate method has been chosen. To assay the activity the pour plate method was carried out using plant pathogenic microorganisms including various bacteria. Finally determined the zone of inhibition.

RESULTS AND DISCUSSION

*Mucuna pruriens* commonly known as Atmagupta widely used Ayurvedic medicine in India. In the present days the whole plant *Mucuna pruriens* are used for antimicrobial properties for extracting plant metabolites against plant pathogenic bacteria and fungi by using agar diffusion methods and the zones of inhibition were calculated and noted down in the tabular form.

The chloroform and benzene extract of *Mucuna pruriens* seed has shown antimicrobial activity against *Arthrobacter protophormiae*, *E. coli*, *Condida albicans* and *Rhodococcus rhodochrous*. Zone of inhibition was measured (Table 4 & Figure 3.) and compared activity of benzene extract and chloroform extract of *Mucuna pruriens* with standard drug (Figure 1 & 2.).

CONCLUSION

The chloroform extract of *Mucuna Pruriens* inhibit the growth of some of the tested micro-organisms (gram positive & gram negative). The Chloroform extract at a concentration exhibited the antimicrobial effect against all the tested micro-organisms. The extract showed strong antimicrobial activity against *Arthrobacter protophormial* and showed the minimum activity against *E. coli*, *Condida albicans*, *Rhodococcus rhodochrous* in compared to standard solution of antibiotic (Amoxicilline).

The Benzene extract of *Mucuna Pruriens* inhibit the growth of some of the tested micro-organisms (gram positive & gram negative). The Benzene extract at a concentration exhibited the antimicrobial effect against all the tested micro-organisms. The extract showed minimum antimicrobial activity *Arthrobacter protophormial*, *E. coli*, *Condida albicans*, *Rhodococcus rhodochrous* in compared to standard solution of antibiotic (Amoxicilline).
