**ABSTRACT**

Introduction: The present interest is to find out the free radical scavenging activity and liver protection activity of whole plant extracts of *Elytraria acaulis* against CCl₄ induced hepatic damage.

**MATERIAL AND METHODS**

Plant material: The whole plant of *Elytraria acaulis* were brought from the forest area of the Gadur Village, Warangal district, Telangana State. The plants materials are generally practiced by the village tribal people for various ailments. (*Elytraria acaulis* is for asthma, migraine, snake bite, mammary tumor etc). The *Elytraria acaulis* plant is already proved its anti hyperglycemic activity. The collected plants were authenticated, given voucher number and preserved in the laboratory.

Hydroalcoholic Extract: The whole plant were dried under shade and the powder was prepared from extracts. The powder (50 gr) was kept in the hydroalcoholic (250 ml) solvent (70% of ethanol, 30% of distilled water) and allowed for 24 hrs with the random shaking. Then the filtrate-I was collected and the marc again allowed in 250 ml of hydroalcoholic solvent for 6 hrs and collected the filtrate-II. Then the filtrates (I&II) were performed distillation to get extracts and stored in refrigerator prior to treatment.

Aqueous Extract: The whole plant were dried under shade and the powder was prepared from extracts. The powder (50 gr) was kept in the aqueous (250 ml) extracts and allowed for 24 hrs with the random shaking. Then the filtrate-I was collected and the marc again allowed in 250 ml of aqueous extracts for 6 hrs and collected the filtrate-II. Then the filtrates (I&II) were performed distillation to get extracts and stored in refrigerator prior to treatment.

**INTRODUCTION**

Though the Science is enormously developed certain diseases and syndromes are unable to be tolerated by the human being because of their dominance against human being. Some of the diseases like cancer, HIV, malaria etc. are still in the mind of Scientists to which they are unable to find out solution. Though, the development is enormous in various fields the poor unable to get the treatment facility. That’s why the people preferring the local doctors. Sometimes the treatment of those practitioners may workout or not. But ultimately, the poor only suffer with the results. The ancient practitioners for medicine depending on the plants can solve the various diseases, which are uncovering by the researchers to the people. Among them there are several plants that have the capacity to combat against the disorders in the liver.

Liver is vital organ, which is maintaining of metabolic reactions in the human body. But unnecessary food habits, consuming of impure drinks may bring problems in functionizing the liver. Consuming more number of drugs also cause the liver damage intaking of alcohols, junk food etc are also questioning the functional ability of the liver by damaging the liver architecture. Damage of liver can be assessed by the elevated levels of serum enzymes like SGOT, SGPT and bilirubin. Though the huge utilities of allopathic drugs are available they are not fulfilling the solution. But the medicinally valued plants are capable to target these types of problems. In that attempt many plants are proved that they possess the hepatoprotective activity. Plants having the capability of fighting against free radicals generated in the body leads to protection of vital organs like liver.

The present experiment was conducted for 7 days to evaluate the hepatoprotective activity of plant *Elytraria acaulis* in CCl₄ (1ml/kg) treated rats. The extracts were prepared by the *Elytraria acaulis* whole plant extracts in ethanol and aqueous solvents through maceration technique. The 6 groups were maintained as control, CCl₄ induced, CCl₄+ Liver tonic, CCl₄+Elytraria acaulis extracts (ethanol 200mg/kg and aqueous 200mg/kg). On the 8th day blood was collected for the study of serum enzymes like SGOT (Serum Glutamate Oxaloacetic Transaminase), SGPT (Serum Glutamate Phosphate Transaminase) and bilirubin and then the separated liver is processed for the histological studies. The decreased levels of SGOT, SGPT and total bilirubin in the treated rats were an indication of the hepatoprotective activity of extracts of *Elytraria acaulis*. The histological changes are also evidence for hepatoprotective activity of extracts. All the values are significant at p<0.05.
Histological sections of liver

Animal models: Albino rats (Wistar strain) weighing 150 to 200gr were brought from Mahaveer Enterprizers, Hyderabad. The rats were housed and acclimatized to standard laboratory conditions. The animals were fed with standard diet (Hypro feed for animals, Pune) and water provided at ad libitum.

Toxic study of the extracts:
Hydroalcholic Extract: To study the toxicology of hydroalcoholic whole plant extracts of *Elytraria acaulis*, the doses (150,200,250,300 mg/ kg) were administered to the rats (5 groups – 8 animals in each group) and put under observation for 72 hrs⁶. There was no toxic effect observed to the rats and the 200 mg / kg were selected for the treatment.

Aqueous Extract: To study the toxicology of aqueous extract whole plant extracts of *Elytraria acaulis*, the doses (150,200,250,300 mg/ kg) were administered to the rats (5 groups – 8 animals in each group) and put under observation for 72 hrs⁶. There was no toxic effect observed to the rats and the 200 mg / kg were selected for the treatment.

Experimental Design: The animals were divided into 5 groups of 8 in each

- **Group-1** treated with dist. water for 7 days (Control).
- **Group-2** CCl₄ (Carbon tetra chloride) was given intra peritonially (1ml/ kg) with 1:1 dilution of coconut oil on the 5th day³.
- **Group-3** Administered with liver tonic (5ml/kg) daily for 7 days and on 5th day the CCl₄ is induced through i.p. (1 ml / kg).
- **Group - 4, 5** were treated with *Elytraria acaulis*’s hydro alcoholic whole plant extract-EAHE, aqueous extract-EAAE (200mg/kg, 200 mg/kg) for 7 days, CCl₄ is administered on the 5day³.

On the 8th day, all rats were sacrificed and the blood collected, centrifuged and the collected serum samples were studied for SGOT, SGPT and bilirubin (through commercially available kits) tests for the study of the toxic effect of CCl₄ and also the therapeutic effect of the plant extracts. The livers were fixed in the fixative (Bouin’s fluid) for the histological study. The results were analyzed by one way ANOVA and Dunnet multiple comparison test with the significant level at p<0.05.

**RESULTS**

The results were observed that the serum parameters like SGPT values were increased in the CCl₄ induced rats (112.60±4.51). SGOT, bilirubin values were also indicating the damage of the liver in the CCl₄ induced rats.

A K. Evaluation of hepatoprotective activity of A. The results that observed were supporting the hepatoprotective activity further study. The histology sections are also revealed that the rearrangement of damaged cells. The histology is more observed in the group CCl4 treated rats. The values of SGOT (66.99±0.86), SGPT (69.54±1.63) and bilirubin (0.92±0.14) were noted in the group CCl4 treated rats. The decreased levels of SGOT, SGPT and bilirubin levels were seen in the CCl4+ EAHE 200mg (62.68±2.98, 58.88±1.01, 0.99±0.09), 200mg/kg (57.68±2.47, 54.48±1.06, 0.83±0.06) respectively.

DISCUSSION

CCl4 damages the liver by its metabolite CCl3 free radical, with which the damage of cellular membranes occur through the lipid peroxidation. The serum parameters like Serum Glutamate Oxaloacetic Transaminase (SGOT) or Aspartate Transaminase (AST), Serum Glutamate Phosphate Transaminase (SGPT) or Alamine transaminase (ALT), including the bilirubin content also elevated because of their release into the blood in the CCl4 induced hepatotoxic rats (Table-1). Whereas, the EAHE, EAEE treated rats serum parameters revealed the significant decrease in the SGOT (66.99±0.86), SGPT (69.54±1.63) and bilirubin (0.92±0.14) levels compare to the CCl4 induced rats (Table-1). These enzymatic values were also decreased in the liver tonic treated rats. The hepatoprotection of the drug depends on the reduced effects of toxic levels of the CCl4 in the damaged liver. The results that decreased levels of SGOT, SGPT and bilirubin in the EAHE, EAEE treated rats against CCl4 were observed similar to the results of the hepatoprotective activity of poly herbal drug against CCl4 damaged liver.

The histological sections are also revealed that the hepatocellular damage in the CCl4 induced hepatotoxic group (figure-2) (Table-1). The EAHE + CCl4, EAEE + CCl4 (200mg/kg, 200mg/kg) i.e., group-4, group-5 were showed the rearrangement of damaged cells. The histology is more observed in the group –5 (figure 3, 4). The histology can be easily comparable with the liver tonic+ CCl4 group rats. The results that observed were supporting the protective activity of the liver though they were damaged by the CCl4. The results are supporting the hepatoprotective activity further study is needed to confirm the activity.

ACKNOWLEDGEMENT
