**ABSTRACT**

*Acorus calamus* is a herb used for the appetite and as an aid to the digestion. It is used for fevers, stomach cramps and cholic. Their rhizomes were used for toothache and powdered rhizome for congestion. The rhizome part is also used to treat several diseases like asthma and bronchitis and as sedative. Native tribes treated cough by making a decoction of the plant as a carminative and also for cholic. It is a main medhya drug, which has the property of improving the memory power and intellect. *Acorus calamus* is used in the conditions of vata and kapha, stomatopathy, hoarseness, flatulence, dyspepsia, helminthiasis, amenorrhea, dysmenorrheal, nephropathy, calculi, stragury. *Acorus calamus* leaves, rhizomes and its essential oil has many biological activities like antispasmodic, carminative and also used for treatment of epilepsy, mental ailments, chronic diarrhea, dysentery, bronchial catarrh, intermittent and tumors. It also has the insecticidal, antifungal, antibacterial, tranquilizing, antidiarrhoeal, antidiabetic, neuroprotective, antioxidant, anticholinesterase, spasmolytic, vascular modulator activities. The parts used in most of the experimental studies are the leaves, roots and stem of the plant. The dry rhizome contains some of the yellow aromatic oil, calamus oil that are associated with the curative nature. Studies were also done on their rhizome part and in its oils in order to identify the active constituents and its medicinal values.

**Keyword:** *Acorus calamus*, Insecticidal, Anti-fungal, Antitumour, Anti-inflammatory activity

**INTRODUCTION**

Mother earth has bestowed to the mankind and various plants with healing ability for curing the ailments of human being. This unique feature has been identified since prehistoric times. The WHO has also estimated that 80% of the world population meets their primary health care needs through traditional medicine only. Medicinal plants are those plants possessing secondary metabolites and are potential sources of curative drugs with the very long list of chemicals and its curative nature. India is the eighth largest country having rich plant diversity with a total of around 47,000 species, of which more than 7500 species are being used as medicinal plants. Plant products are used as main source of medicine throughout the world for treating various human ailments. About 50% of the present day medicines in the United States of America are derived from natural sources especially from various plants. The use of traditional medicine in both developing and developed countries is significantly increasing in recent times. There is a growing demand for medicines of Ayurveda, Siddha, Unani and Homeopathy for domestic consumption and export purposes. The world trade in plant based drugs and its products are many fold expanding continuously; because the general awareness of the wide spread toxicity and harmful after effects associated with the long-term use of synthetic drugs and antibiotics. *Acorus calamus* is a tall perennial wetland monocot plant from the Acoraceae family. The scented leaves and rhizomes of sweet flag have been traditionally used as a medicine and the dried and powdered rhizome has a spicy flavour and is used as a substitute for ginger, cinnamon and nutmeg for its odor. It is known by a variety of names, including cinnamon sedge, flag root, gladdon, myrtle flag, myrtle grass, myrtle sedge, sweet cane, sweet myrtle, sweet root, sweet rush and sweet sedge. *A. calamus* is probably indigenous to India and now found across Europe, Southern Russia, Northern Asia Minor, China, Japan, Burma, Sri Lanka, and Northern USA. *Calamus* was valued as a stimulant, bitter herb for the appetite and as an aid to the digestion. In North America, the decoction was used for fevers, stomach cramps and colic; the rhizome was chewed for toothache and powdered rhizome was inhaled for congestion. In Ayurvedic medicine *Calamus* is an important herb, and is valued as a "rejuvenator" for the brain and nervous system, and as a remedy for digestive disorders. The various extract of *Acorus calamus* is traditionally used for the anti-diabetes, anti-proliferative, immunosuppressive, hypolipidemic, mitogenic and anticarcinogenic activity towards human lymphocytes. The different extract forms possess the antispasmodic, anthelminthic, antifungal, antibacterial, fish toxin,
insecticidal, anti-diabetes, anti-proliferative, immunosuppressant, anti-diarrhoeal, antioxidant and hypolipidemic activities. The rhizomes and leaf part were found to possess the mitogenic and anti-carcinogenic activity towards human lymphocytes. The rhizomes are also used for treatment of epilepsy, mental ailments, chronic diarrhea, dysentery, bronchial catarrh, intermittent fevers, cough, throat irritations, bronchitis, as expectorant, and tumors.

**Parts used**
The parts used are leaves, root (rhizome) and stem. In Asia, Sweet flag has been used for at least the last 2000 years. The ancient peoples of China used it to lessen swelling and for constipation. In Ayurvedic medicinal practice, India, the rhizomes have been used to cure several diseases like fever, asthma and bronchitis, and as a sedative. Native tribes used it to treat a cough, made a decoction as a carminative and as an infusion for cholic. In Western herbal medicine the herb is chiefly employed for digestive problems such as gas, bloating, colic, and poor digestive function. Calamus helps distended and uncomfortable stomachs and headaches associated with weak digestion. Small amounts are thought to reduce stomach acidity, while larger doses increase deficient acid production, a good example of how different doses of the same herb can produce different results. It is a good sedative so that the extract is used for epilepsy, insanity and as a tranquilizer along with *valeriana jatamansi* and *nardostacys grandiflora*. It is an ingredient of any Ayurvedic preparation “Brahmi Bati” (Budhivardhar) which is indicated in epilepsy, coma, and hysteria and in cases of mental retardation; the same uses are prescribed for an *Acorus* containing Unani drug “Ma’jun Baladur”.

**Pharmacological activities**
The rhizomes of *A. calamus* reportedly relieve stomach cramps, dysentery and asthma, and are used as: anthelmintics, insecticides, tonics and stimulants. Alcoholic rhizome extracts of *A. calamus* growing in KwaZulu-Natal, South Africa, were previously found to have anthelmintic and antibacterial activity Table I. Using bioassay-guided fractionation, the phenylpropanoid ß-asarone was isolated from the rhizome. This compound was shown to possess anthelmintic and antibacterial activity. It has previously been isolated from *A. calamus*, and a related species, *A. gramineus*. Different varieties of *A. calamus* exhibit different levels of ß-asarone, with the diploid variety containing none of the compound.

Mammalian toxicity and carcinogenicity of asarones has been demonstrated by other researchers, supporting the discouragement of the medicinal use of *A. calamus* by traditional healers. In medical research, more attention is paid to the antioxidant properties of medicinal plants to minimize the harmful effects of radicals.

**Insecticidal activity**
The insecticidal activities of compounds derived from the rhizomes of *A. gramineus* against four agricultural insect pests were examined using direct contact application method. The biologically active constituents of *A. gramineus* rhizomes were characterized as the phenylpropenes, cis- and trans-asarones by spectroscopic analyses. Potencies varied according to insect species, compound, and dose. In a test with female adults of *Nilaparvata lugens*, cis-asarone caused 100, 83 and 40% mortality at 1,000, 500 and 250 ppm, respectively, whereas 67% mortality was achieved at 1,000 ppm of trans-asarone. Against 3rd instar larvae of *Plutella xylostella*, cis-asarone gave 83 and 50% mortality at 1,000 and 500 ppm, respectively, whereas trans-asarone at 1,000 ppm showed 30% mortality. Against female adults of *Myzus persicae* and 3rd instar larvae of *Spodoptera litura*, cis- and trans-asarones both were almost ineffective at 2,000 ppm. The *A. gramineus* rhizome-derived materials merit further study as potential insect-control agents or as lead compounds against *N. lugens* and *P. xylostella*.

**Anti-fungal activity**
ß-asarone compound fraction obtained from the crude methanolic extract of *Acorus Calamus* rhizomes has been reported to possess the antifungal activity against the yeast strain of *Candida Albicans*, *Cryptococcus Neoformans*, *Saccharomyces Cerevisae* and also against *Aspergillus Niger*.

**Antitumour**
It was reported to be a potent antitumour agent against Daltons Asctises Lymphoma in mice by evaluating the tumour growth, toxicity and haematological parameters. **Anti-inflammatory activity**
*Acorus calamus* is a traditional remedy for the inflammation problems but their biological function in the human skin cells not well characterized. *Acorus calamus* has been found to inhibit the expression of poly: C-induced IL-6 and IL-8 which indicates their inhibitory effect on the expression of the cytokines which were likely to be in association with the suppression of NF-κB activation and phosphorylation of IRF3 that shows the *Acorus calamus* L. may be used as a promising immunomodulatory agent in the inflammatory skin diseases.

**Anti-oxidant activity**
*Acorus calamus* extract showed a remarkable increased and decreased levels of certain parameters due to the exposure to noise-stress which ultimately proves their antioxidant activity. *Acorus calamus* has been found to render the protection against γ-radiation induced oxidative stress.

**Antidiabetic activity**
*Acorus calamus*, is widely used in the treatment of diabetes in the traditional folk medicine of America and Indonesia. Four fractions obtained from the radix of *Acorus calamus* were used for insulin releasing or alpha-glucosidase inhibitory action.

**Larvicidal property**
A. calamus carries huge potential as a mosquito larvicide. This potential could be exploited for the development of safer and effective botanical mosquito larvicidal tool for the management of *Aedes aegypti*.

**CNS activity**
The methanol and acetone extract of the plant possess certain psychoactive substances that are found to be depressant in nature. The extract produced alterations in
the general behavioral pattern and does not induce any disturbances in the motor co-ordination. The methanol and acetone extract of the leaves of the plant possess CNS depressant activity which can be further utilized for its anticonvulsant research. Pharmacological action
Antibacterial activity

The leaf and rhizome part of Acorus Calamus is found to possess the antibacterial activity. The methanolic extract of Acorus Calamus showed the inhibitory action against the bacterial strains of Salmonella typhi, Pseudomonas aeruginosa, Klebsiella pneumoniae, Staphylococcus aureus. β-ararone compound of Acorus Calamus has the highest inhibitory effect against E.coli strain at various concentration23,24.
